RATIONALE FOR INCLUSION IN PA PROGRAM

Background
Santyl (collagenase) ointment is a sterile enzymatic debriding ointment which contains 250 collagenase units per gram of white petrolatum USP. The enzyme collagenase is derived from the fermentation by *Clostridium histolyticum*. It possesses the unique ability to digest collagen in necrotic tissue (1).

Regulatory Status
Santyl ointment is indicated for debriding chronic dermal ulcers and severely burned areas (1).

Summary
Santyl ointment is a sterile enzymatic debriding ointment which contains 250 collagenase units per gram of white petrolatum USP. The enzyme collagenase is derived from the fermentation by *Clostridium histolyticum*. It possesses the unique ability to digest collagen in necrotic tissue. Santyl ointment is indicated for debriding chronic dermal ulcers and severely burned areas. Use of Santyl ointment should be terminated when debridement is complete and granulation tissue is well established (1).

Prior authorization is required to ensure the safe, clinically appropriate and cost effective use of Santyl ointment while maintaining optimal therapeutic outcomes.
